

Success-Story: Germanwings successfully tested their web applications with the n.sure service by n.runs AG

Germanwing's „self-service“ technology is the core of the business model of the airlines. This technology enables the customers of Germanwings to purchase tickets and manage their travelling activities via Internet and mobile devices. Therefore, quality, availability and especially security of the complex web applications are business-critical for Germanwings. To ensure the sustainable securing of those parameters Germanwings was looking for an optimal solution.

The requirements were to test the complex web applications automated but profound on a regular basis, to be provided with detailed and meaningful reports at the push of a button and to get verifications by manual tests, if required. The optimal solution was offered by the n.runs AG with their n.sure services. With arbitrary repeatable automated scans and clearly arranged reports which can be verified by the experienced n.runs security consultants, where applicable, the scalable n.sure services fulfilled all requirements of Germanwings.

“We are deeply convinced of the high level of professionalism, speed and the excellent results of the n.sure services“, said Stefan Albrecht, head of IT and VP of the airlines. “The n.sure service offers optimal security and high reliability by combining automation and manual verification of the results, together with easy handling and cost-effectiveness“.
